With many manufactures competing for the owners business, Contractors need to understand how important chemical compatibility is with the product and what products are effective.

We see some roof contractors apply materials that are not compatible and they fail very quickly causing the owner to have to pay for a clean up and a new repair. This often means new materials must be stripped in.

Electronic Roof Testing (Thermoscan) is available to help our customers or owners confidence in our recommendations. This technology helps us recommend only the options that are suitable for your facility.

Dunlop has 25 years of experience working with state of the art products and repairing technologies. We have years of experience with the in and outs of the roofing industry to make the best decision for your roof repair or replacement.

Using good quality repair products and good installation methods, leads to successful long term repairs that are backed up without extended warranties.
